

CSS for Surveys

Brief Overview

Cascading Style Sheets (CSS) allows you to apply advanced customization to Surveys including elements such as the font, background, and border.

CSS can be used to customize Surveys and NPS Surveys:

- Action and Close buttons
- Text for Title
- Text
- "X" button

How It Works

Cascading Style Sheets (CSS) is a style sheet language used for describing the formatting of a document written in a markup language. When writing CSS, you will need to refer to the different components (technically known as elements) of the Survey. When typing into the Custom CSS window, WalkMe displays autocomplete options for selectors, properties, and values.

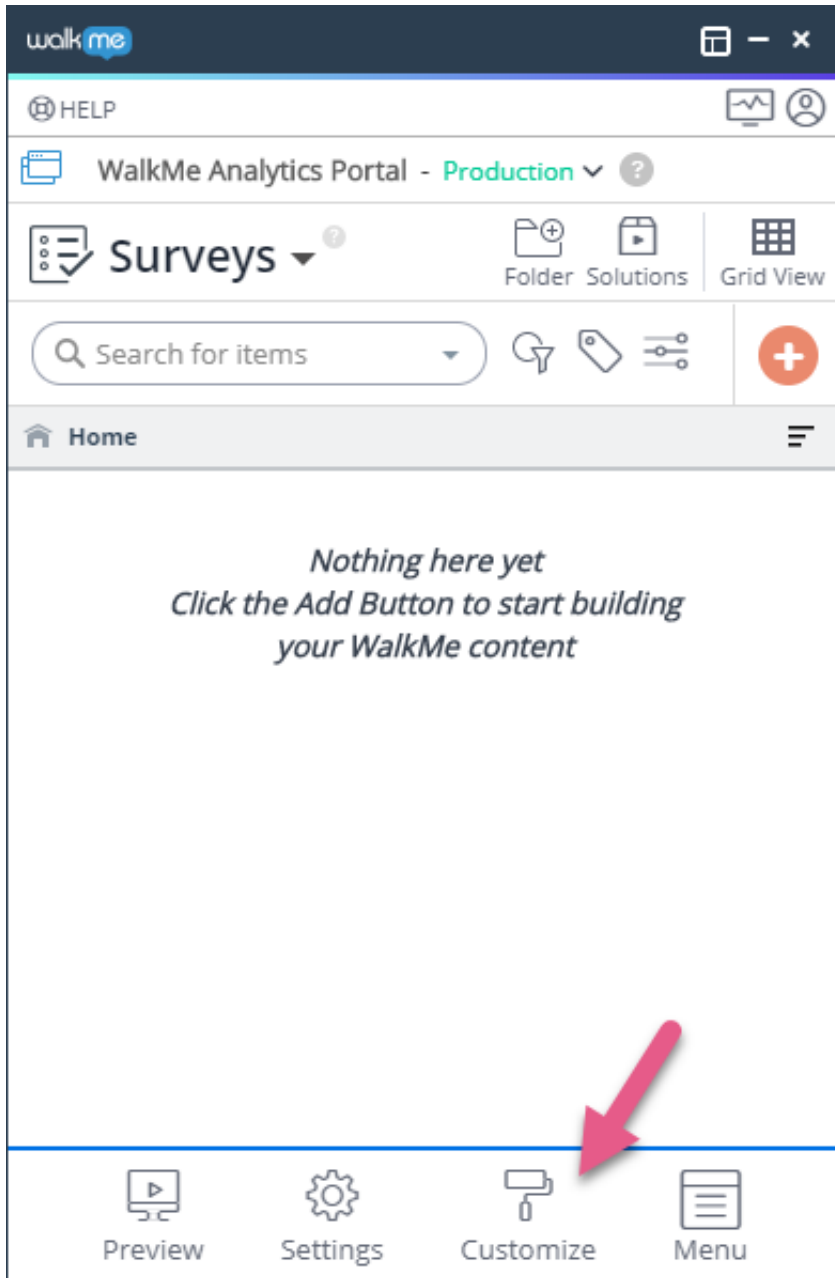

Settings Breakdown

Configuring Balloon Components

Each Survey includes a number of components (elements) that can be customized with CSS. For example, you can target the title section of a Survey by using this class: `.wm--survey-title` (see below for a full list of classes).

Global Rules

Global CSS for surveys can be added in the Customize menu:

Finding Survey ID

- Hover over the name of your Survey
- Navigate to the Pencil Icon
- Click on "Copy ID"

Using !important

By default, the WalkMe theme design overrides any other design changes to a balloon or app. In order for CSS to be applied, the CSS rule must contain "!important" to ensure that it overrides the default styling.

For example:

```
#walkme-survey-balloon-37897 .walkme-survey-title {  
color: #000 !important;  
}
```

Configurable Survey Components

	DIV	EDITABLE FEATURES
1	#walkme-survey-balloon-37897
