

<u>Creating General Tracked Events in Insights</u>

Brief Overview

This article explains how to create a Tracked Event to track user engagement with your website or application.

To learn more about what Tracked Events are, please refer to the following article: <u>About Insights</u> <u>Tracked Events</u>.

How It Works

Tracked Events Setup page

To create a Tracked Event, you must go to the **Tracked Events Setup** page in <u>Insights</u>, accessible at <u>insights.walkme.com</u>.

Make sure that you have the correct system open.

Tip

To learn more about navigating Insights, please refer to the following article:

• Insights: Getting Started Guide

1. + NEW EVENT

- **CUSTOM SETUP** button
- CAPTURE EVENT button

2. Tracked Events Summary Table

- 1. Type: Each event has a different icon that corresponds to its type
- 2. **Name**: This is the name the event's creator gave to the Tracked Event
- 3. **Definition**: This is the criterion that must be met before the Tracked Event is considered to have occurred
- 4. Created: This is the date the Tracked Event was created
- 5. Modified: This is the date the Tracked Event was last modified

Creating a Tracked Event

Digital Adoption Institute

- View the <u>Analyzing a Digital Adoption Project with WalkMe Analytics</u> course in the DAI
- Don't have a DAI account yet? Sign up here

Method 1 - Capture Event

Prerequisites

- The WalkMe Editor Extension and Editor app are installed
- You are logged into the WalkMe Editor with your Insights user account
- A settings publish was performed

Instructions

1. Go to the Tracked Events Setup page in Insights

- 2. Click CAPTURE EVENT
 - Note: If the "Capture Event" button is greyed out, this means that DXA is not yet enabled on the account. Please reach out to your Admin to have the setting turned on so you can begin using this feature. Refer to this article for more information: <u>Insights</u> <u>Digital Experience Analytics (DXA) Level</u>
- 3. Enter the URL of the page where you want to capture the element and click LET'S GO

Choose page to capture Choose the page you want to capture events in					
https://www.walkme.com					
LET'S GO	CANCEL				

- 4. Capture the target element
- 5. Review the data provided about the captured element and make changes to the settings if needed
 - Note: You will see a message indicating whether or not data already exists matching the

Element Clicked	
 All set! There 	is data matching this definition.
1 Elements Identifi	ied In This Page
Limit to text:	
Appears in 2 other	pages
Limit to page:	https://klawsign.com/app/
Element Selector	
.btn-primary-ish	
RE-SELECT	SAVE & NEW DON

definition

6. Click **DONE**

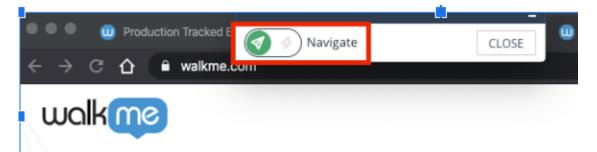

You will be automatically redirected to Insights, where you will see your new Tracked Event.

Limitations to Capture Event method

Switching the Editor to Mobile Web for capturing tracked events isn't supported.

To capture tracked events for Mobile Web, switch the browser to Mobile mode using Dev Tools without switching to Mobile Web in the Editor. Here's how to do it:

1. Switch from the Select Element mode to Navigate

2. Switch back to Select Element mode and capture the target element

	-		Responsive v	524 >	905	100% 🔻	Online 🔻	0
🦪 🚱 Select Element 🛛 🖸	LOSE							
		-						
		walk	me					=
		wein						_
								× 7
		I A						-V

3. Open the browser's dev tools by pressing on F12 and switch the browser's layout display to Mobile $% \left({{{\rm{D}}_{{\rm{D}}}} \right)$

			1						
	6		R D	Elements	Console	»	<u> 4</u> 20	1	×
icing	Company	Request a Demo	vebp-lossle wf-opensans n3-active w opensans-i4 ► <head></head>	g="en-US" (ess wf-open i-i7-active vf-opensans u-active wf lass="home	sans-i6-ac wf-opensa -i3-active -opensans- page-templ	tive wf ns-n8-a wf-ope n6-activ ate pag	<pre>Delpha webp-ani -opensans-n7- ctive wf-opens nsans-n4-activ ve wf-active" pe-template- page-template</pre>	activ sans- ve w1	ve -

Method 2 - Custom Setup

You can manually create a Tracked Event by clicking **CUSTOM SETUP.**

- 1. Enter a name for your Tracked Event
 - **Tip**: Use a naming convention that indicates the user action the Event represents
- 2. Select a definition from the drop down menu • <u>See Available Event Types</u>
- 4. Click + ADD PROPERTY under the Event Properties section
 - Optional: Only available for click or input-type events
- 5. Click SAVE

The new Tracked Event will be available to use in funnels and filters.

Tip

⁷¹ Stevenson Street, Floor 20 San Francisco, CA 94105 | 245 Fifth Avenue, STE 1501 New York, NY, 10016 | 421 Fayetteville St STE 215 Raleigh, NC 27601 www.walkme.com

If you are unable to create a Tracked Event on an iFrame, your Editor may require special configuration. Please reach out to your Customer Success Manager or WalkMe contact for more information.

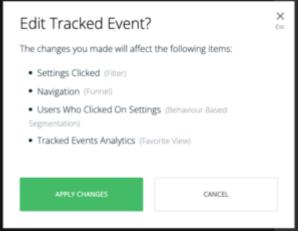

Editing a Tracked Event

When you hover over a Tracked Event you will see the following options:

- Copy button: Duplicate and create a new, similar Tracked Event
- Trash icon: Delete a Tracked Event

affected by the changes

- Pencil icon: Edit an existing Tracked Event
 - You will be prompted to confirm you want to apply changes if there are items that will be

• Recapture Tracked Event button: Edit the Tracked Event by recapturing the target element

Track	ed Events Setup	SE CUSTOM SETUP		
Tracke	d Events Summary		Q Search	
Туре	Name	Definition	Created ~	Modified
1	New Files Clicked	css selector .ui-droppable	12/15/2021	12/15/2021
P2	Notifications Clicked	css selector DIV [href="/app/notifications/"]	12/07/2021	12/07/2021
Þ.	profile item	css selector .profile	12/06/2021	12/06/2021

Available Event Types

Click/Tap	Filter by an element that is clicked or tapped	Elements can be identified using the following: Text is: Identify the clicked element by its content. id: Identify the clicked element by its unique element identifier. class: Identify the clicked element by one or more classes. For more precise results use spaces to also identify a parent element's class. For example, ".shippingForm .saveBtn " CSS selector – read more below
Page View	Filter by a specific URL a user visits	
Input	Filter by input fields a user interacts with	Input fields can be identified using the following: Name is: Identify the input element by the input field name label is: Identify the element by the input field name Class: Identify the input element by one or more classes. Id: Identify the input element by its unique element identifier. CSS selector – read more below

Creating Event Properties

For certain types of Tracked Events (e.g., click/tap and input-type events), you can add event properties. Event properties record what URL the user is on when the event in question occurs (excluding the Page View event type, which already filters events by what URL the user is on).

			CLOSE
New Tracked Event			
User Checks Out		•	
Definition 🕑			
➢ Click/Tap < ❷	CSS selector .butto	n#place_order	OR 🔟
Event Properties op	ional ?		
⊕ URL	Full URL 🔻 http:	://shopme.walkme.com/checkout/	OR 🔟
+ ADD PROPERTY]		

For example, imagine you've created a new Tracked Event called "User Completed Purchase," and you've defined the event as occurring when a user clicks the *Place Order* button with the HTML ID attribute of "place_order," which is available on multiple pages.

You can now add an event property that checks whether the page on which the event occurred contains a particular URL, e.g.: "http://shopme.walkme.com/checkout."

This way the Tracked Events will only count clicks occurring on this element on this specific page only. Otherwise, clicks from all pages would be counted toward the Tracked Event.

Pro-Tip!

Use the Asterix symbol (*) as a "wild card" for example: https://support.walkme.com/knowledge-base/*/

CSS Selectors

CSS selector allows a precise definition of an element to be tracked. CSS selectors allow you to identify elements in the HTML structure based on their characteristics such as id, class, type, attributes, or values of attributes.

Note:

It is recommended to have a basic understanding of writing and using CSS before using it to define your Tracked Events in WalkMe.

How to Use/Build/Create CSS

- Find the element in the HTML by right-clicking on the element and selecting Inspect Element. The element will be highlighted on the screen and in the developer panel. Identify the element's unique characteristics (such as location, class, id, and additional attributes) in order to build your CSS selector.
- Once identified, build your CSS selector. Currently, this is the supported CSS subset:

Supported CSS Attributes		Syntax
ld	The hash selector is used to specifically define an element based on its id attribute	#IdName
Class	The dot is used to specifically define an element based on its class attribute	.className
	tagName, src, href, type, name, Role, Text	
Additional attributes [attribute='value']	The attribute selector is used to specifically define an element based on any of its HTML attributes. By default class and Id attributes are being collected. In order to collect additional HTML attributes, "this should be enabled in the environment settings \rightarrow collection enablement section.	Equals: [attribute=a]Contains: [attribute*=b] Begins with: [attribute^=a] Ends with: [attribute\$=c]
Tag name		Name
Space – Elements hierarchy	The space is used to define hierarchy between elements. '.className .className'	
Combination of the above	#idName. className. className	example: #idName. className. className

Testing Your CSS Selector

• When <u>defining a Tracked Event</u>, Insights will immediately generate a preview of the results from the past 30 days until **now**, meaning it gets updated by the minute. This allows you to understand if any events have already been captured for this definition.

71 Stevenson Street, Floor 20 San Francisco, CA 94105 | 245 Fifth Avenue, STE 1501 New York, NY, 10016 | 421 Fayetteville St STE 215 Raleigh, NC 27601 www.walkme.com

- To verify you identified the correct event as a Tracked Event, you should review the past months' usage for this definition. If you receive zeros as your results, something in the definition might be faulty.
- $\circ\,$ You can also simulate the event on your website and verify it was tracked in real-time.
- $\circ\,$ When Sessions Playback is enabled, you can simply watch a session that the event appears in.

Character Limit

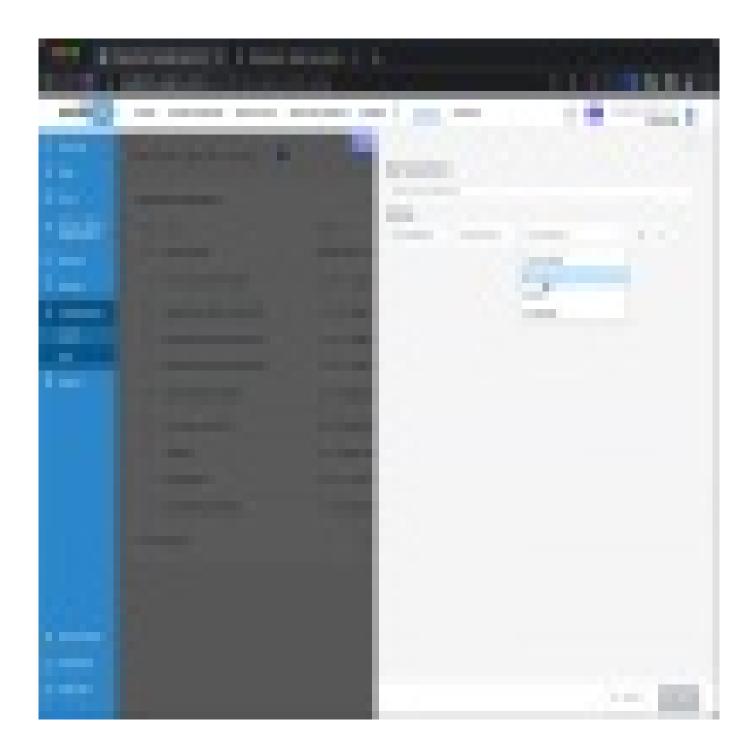

Classes that contain more than 35 characters and IDs that contain more than 40 characters will not be collected so should not be used to define tracked events.
